# DEltas, Vulnerability and Climate Change: Migration and Adaptation (DECCMA, 2014-18)

[www.deccma.com](http://www.deccma.com)

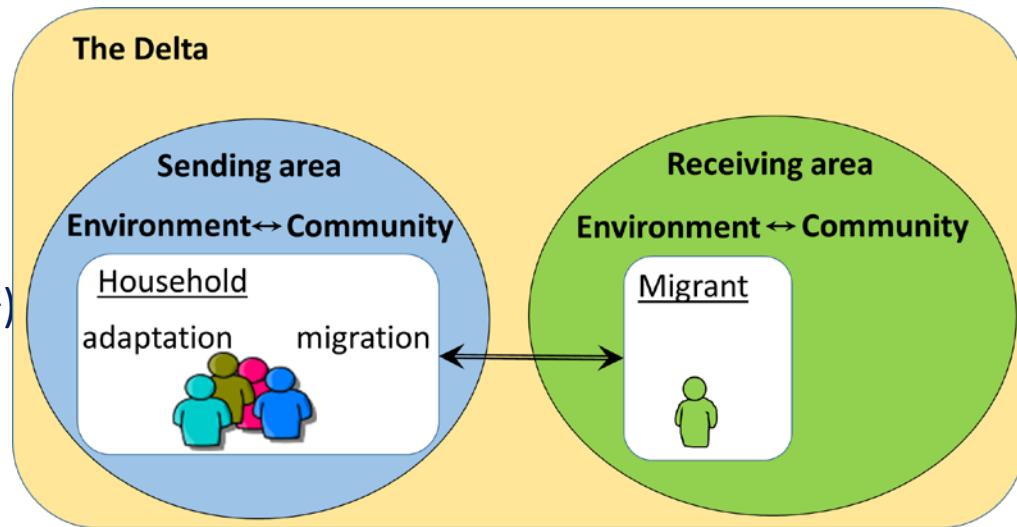

## Key research questions:

1. What are the **advantages and disadvantages of Migration as an adaptation to climate stress?**
2. How can government policy **promote more climate-resilient and successful outcomes for men and women** in the delta?

# Integration within DECCMA

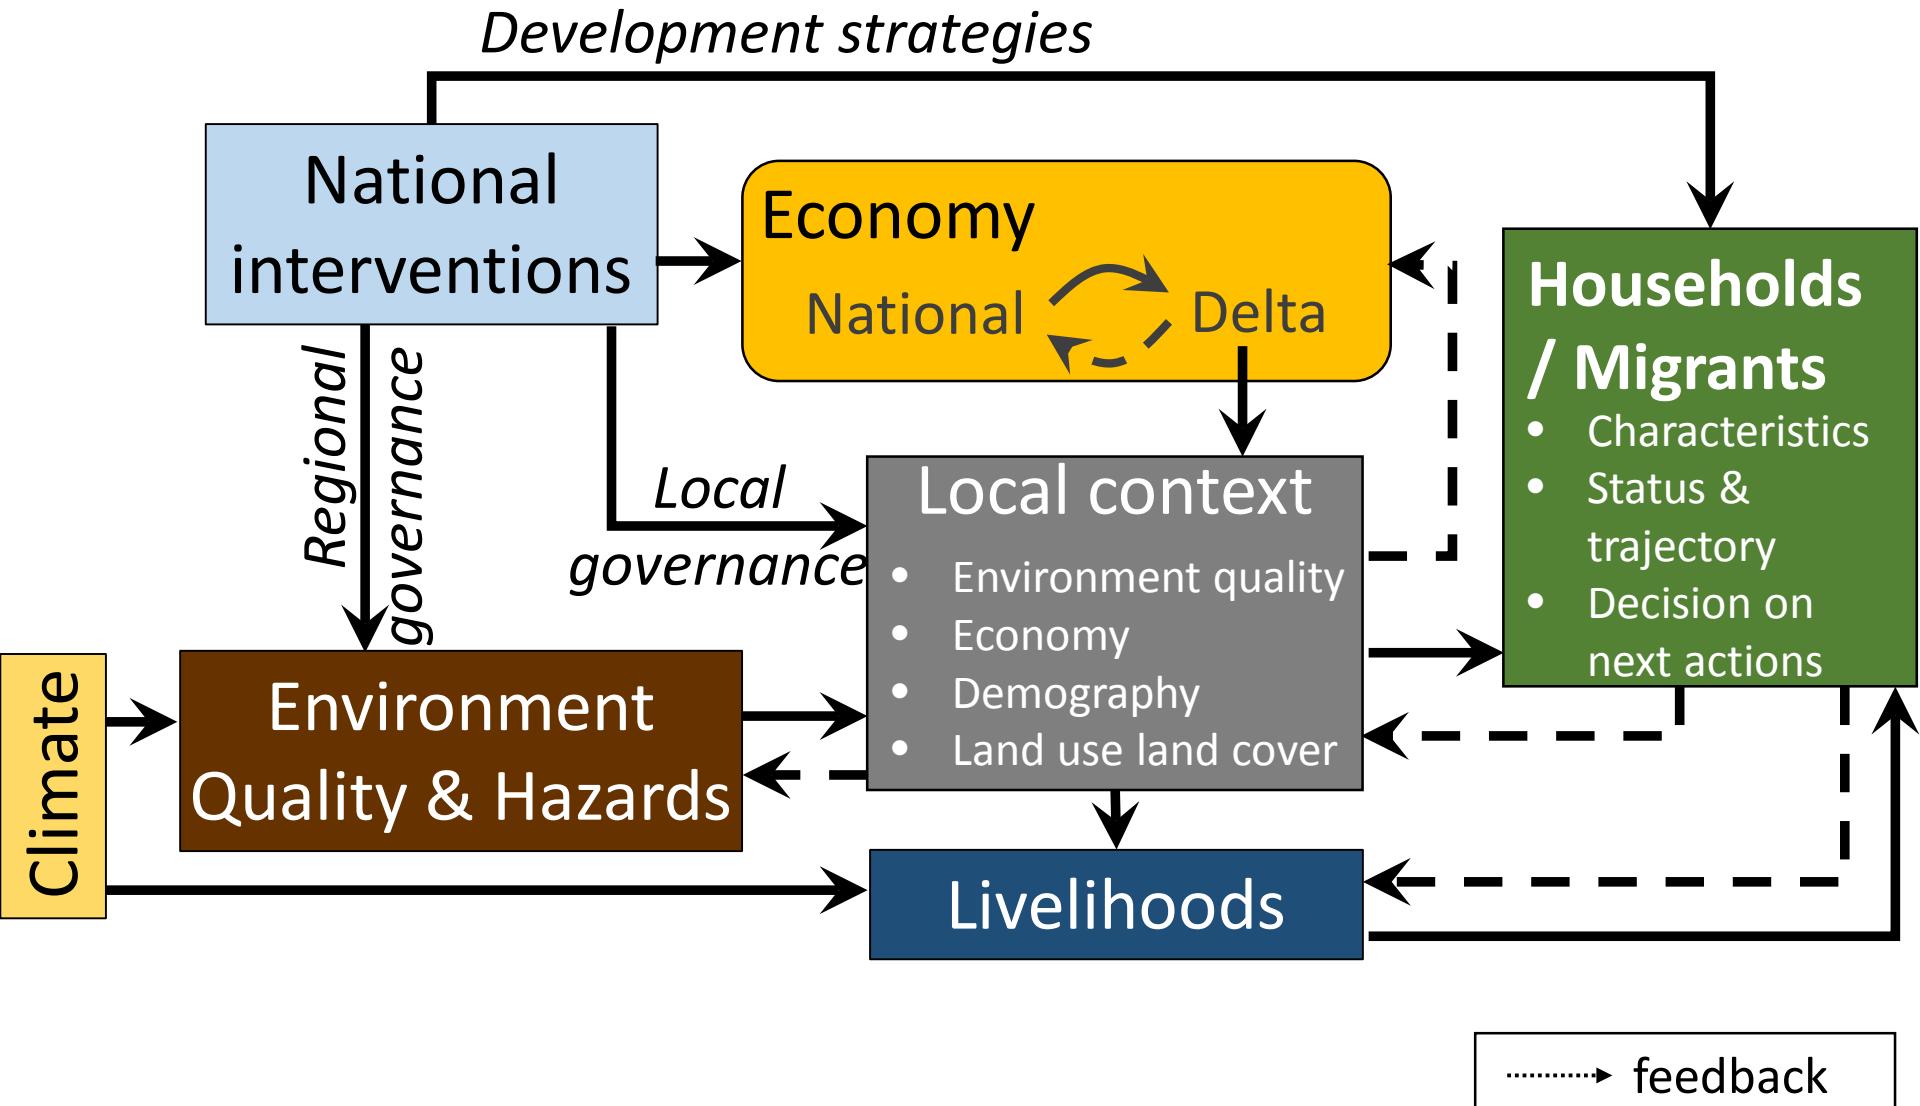

- to develop **a quantitative framework** of the environment, demography, socio-economy and governance using the project outputs (i.e. other WPs)
- to evaluate **plausible adaptation pathways up to 2050**
- to work **across scales**:
  - (national)
  - delta
  - broader community ( $\sim 100\text{km}^2$ )
  - household
  - men & women

Lazar et al (2015): **A method to assess Migration and adaptation in deltas: A preliminary fast track assessment**, DECCMA Working Paper. Available online at: [www.deccma.com](http://www.deccma.com)

# Conceptual model overview

a hybrid method: using emulator, Bayesian Network, ABM components

.....→ feedback

# Household decision model concept

## 1. Do nothing:

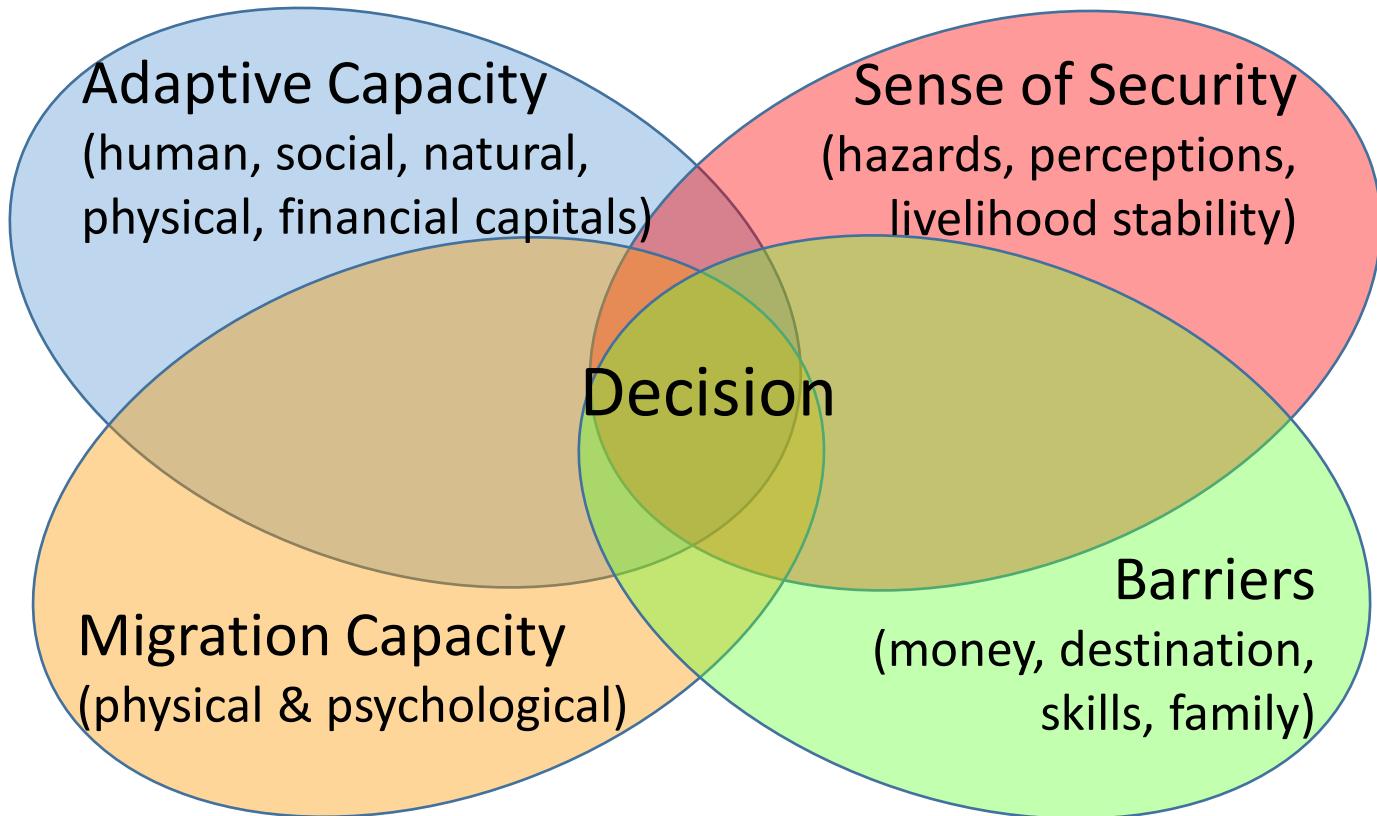

- reduce hhold exp.
- increase hhold exp.
- get a loan

## 2. In-situ adaptation:

- change crop
- diversify livelihood
- change livelihood
- women start working outside house

## 3. Migrate:

- who
- where
- how long

D E C C M A

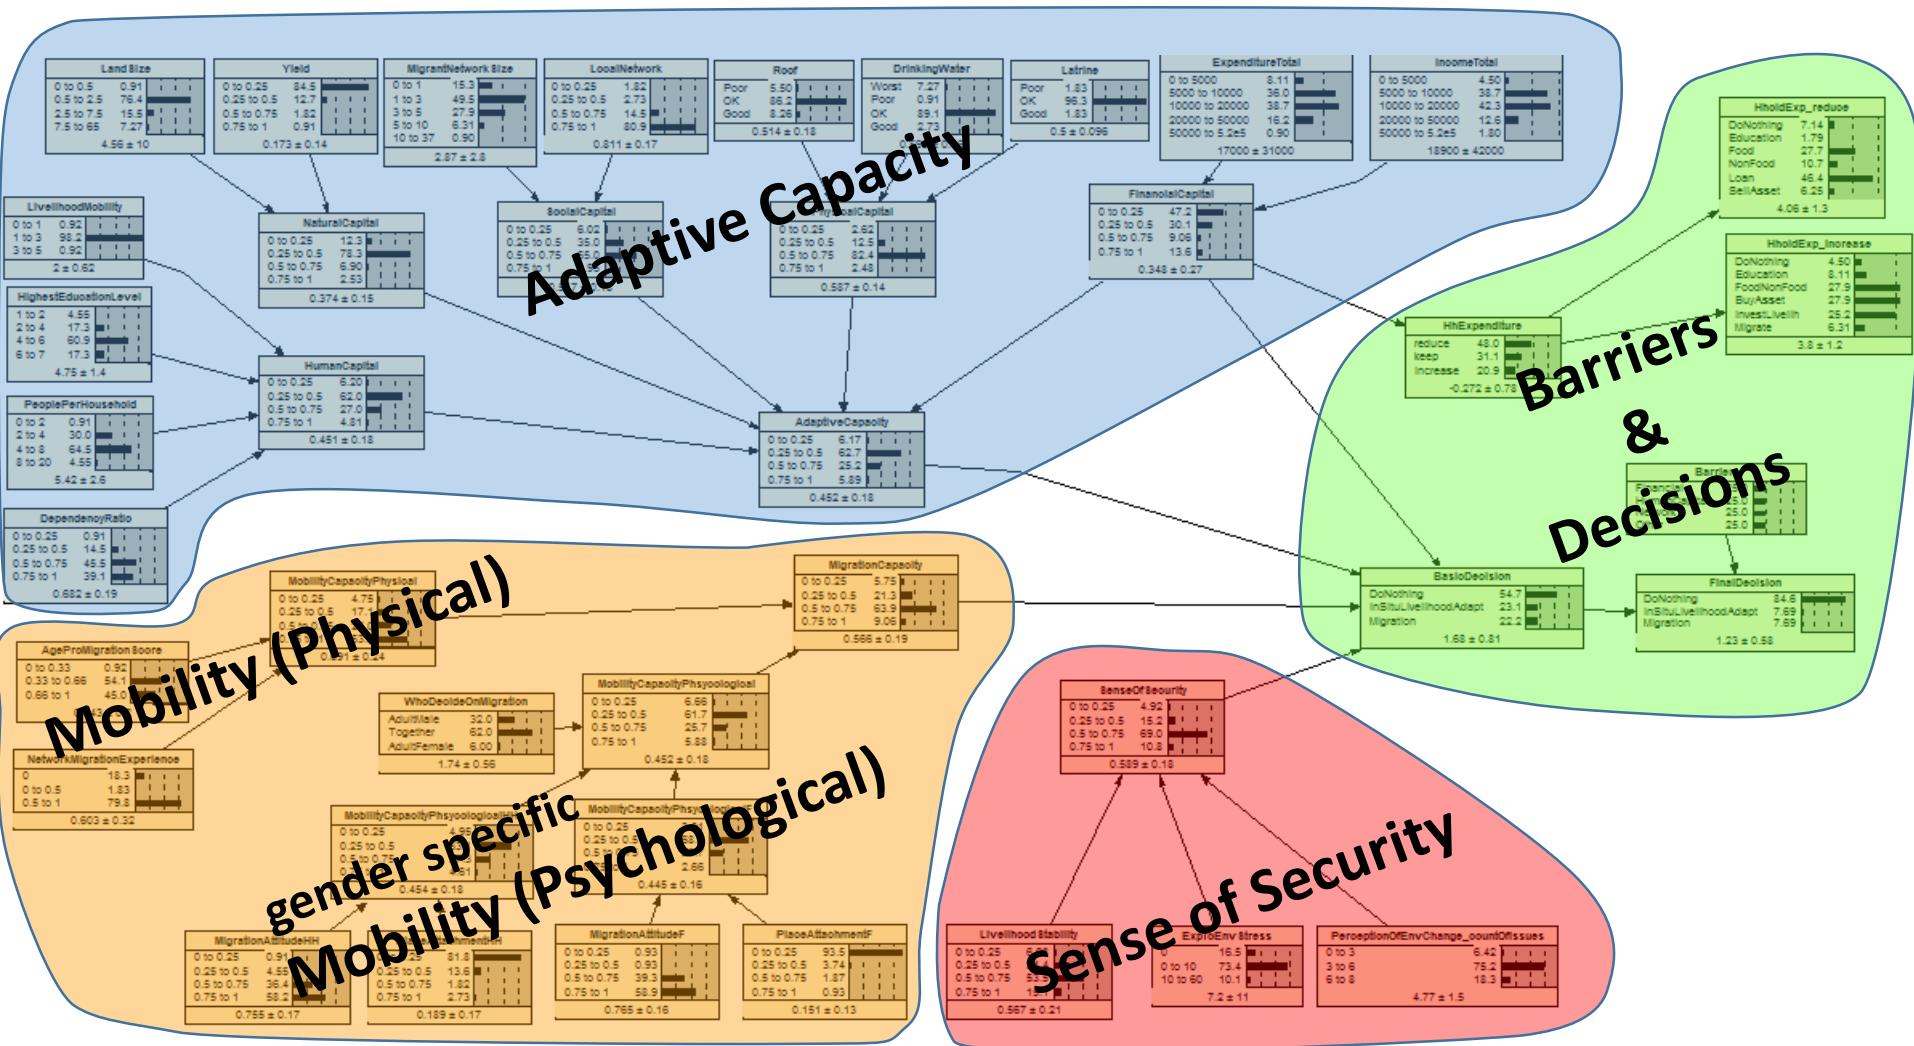

# Input data

- 1500 **household interviews** per study site  
(N=6000, Sending Area)
  - ✓ Separate Household head & Female questionnaires
- 450-1000 **migrant interview** per study site  
(N=3000, Receiving Area)
- **Expert knowledge**

# Household decision model – method 1

(expert opinion + PCA-based)

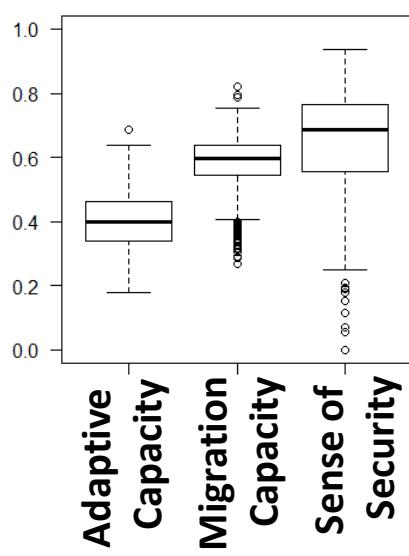

# Household characteristics

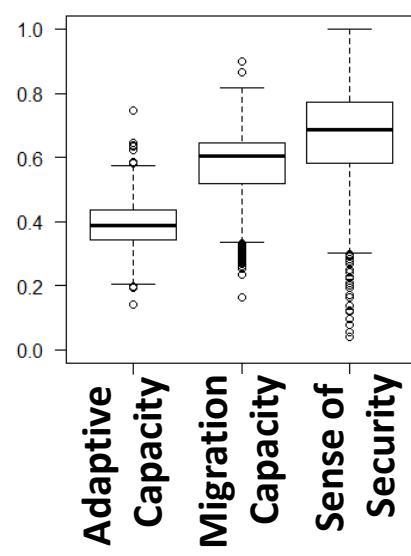

- **Sense of security** is somewhat higher for non-Migrant households
- But **adaptive capacity** and **Migration capacity** is very similar
- So what makes households move? - > need another approach

**Bangladesh**  
(Ghana is similar)

Migrant households

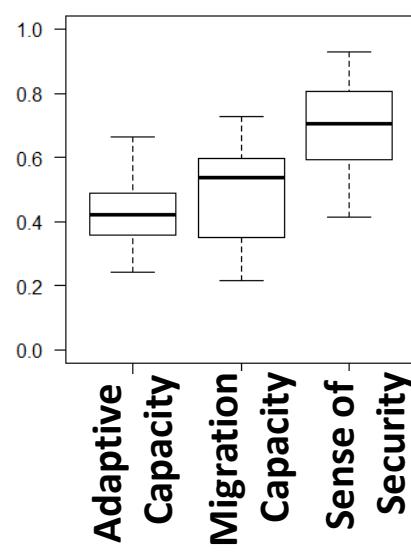

Non-migrant households

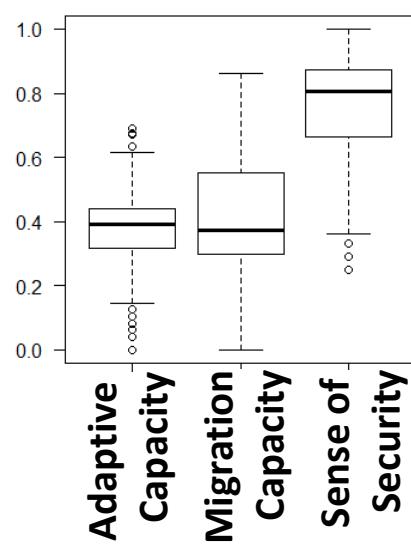

**Indian Bengal Delta**  
(Mahanadi is similar)

Migrant households

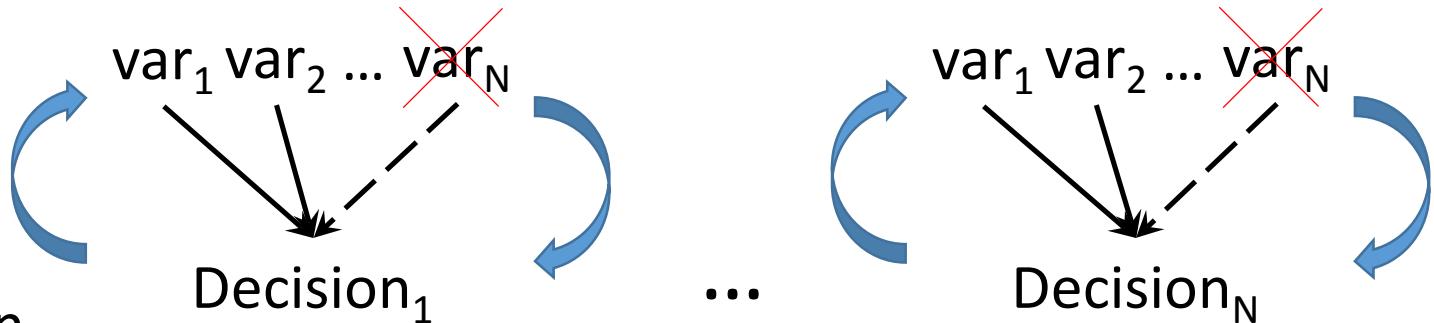

Non-migrant households

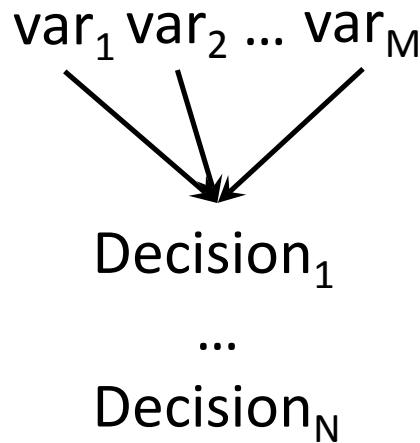

# Household decision model – method 2

(stepwise model reduction method)

1. Training network through variable elimination

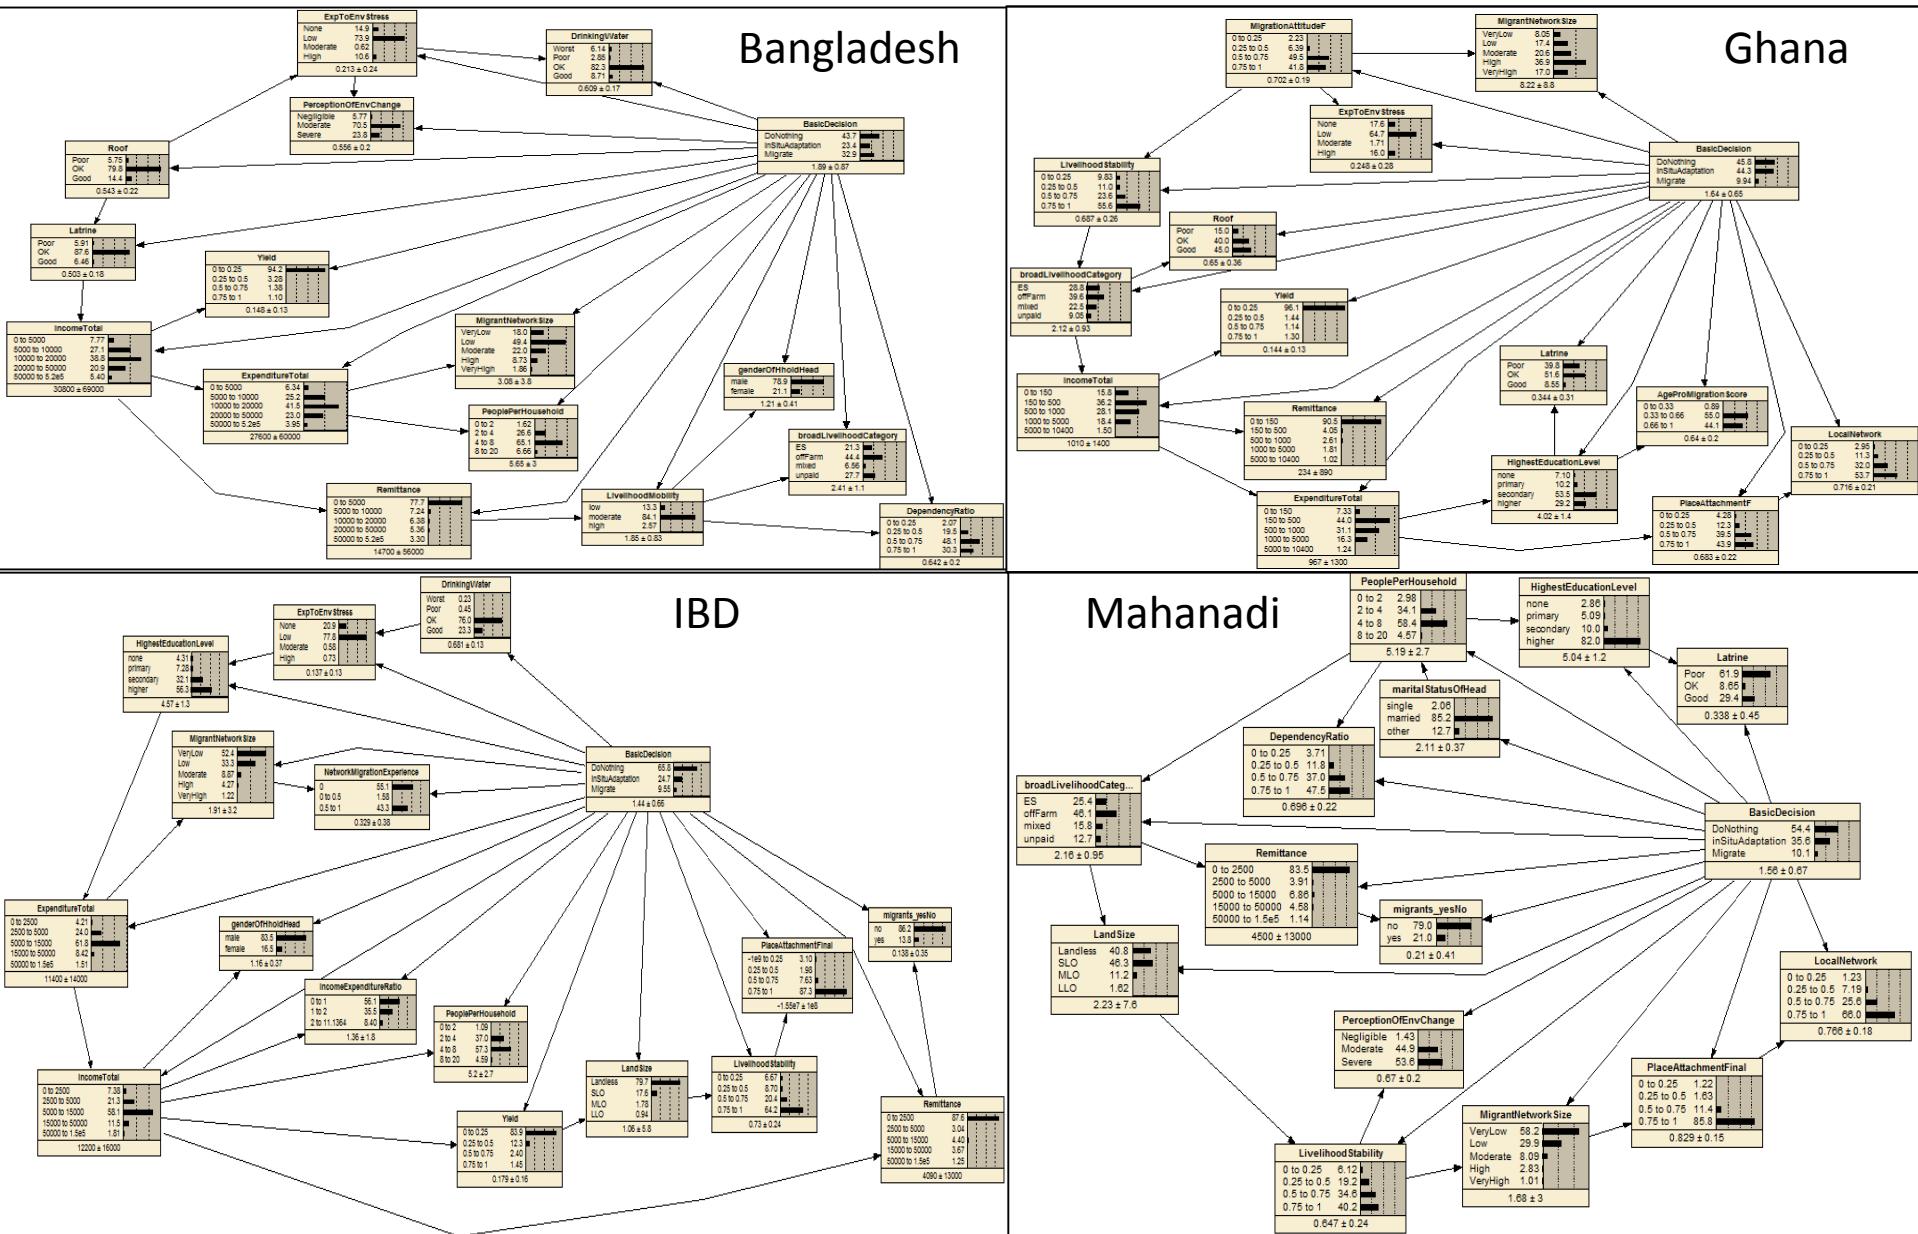

2. Combining final networks together and validation

# Household decision model – method 2

(stepwise model reduction method)

# Household decision model – attempt 2

(stepwise model reduction method)

Mig - Migration

# Illustration of model outputs

○ Poor farmer  
○ Wealthier farmer

- Bayesian statistics allow to model **distributions of inputs** (e.g. env. quality) and **distribution of responses** within a larger area and for an archetypal group.
- Sense of security can be higher for poorer household.
- Richer household have more options and accumulates wealth.

# Summary

- a **hybrid modelling framework** is being developed based on
  - ✓ bespoke sending and receiving area surveys
  - ✓ bio-physical model results
  - ✓ Literature/expert knowledge
- to study **long-term social-environmental-governance interactions**
- different **thresholds, barriers and response strategies** are considered
- **spatial / temporal / archetypal heterogeneity** included
- about a year to finish
